AUTHOR: Kupchinov, I. I., Candidate of Technical Sciences
TITLE: Adjustment of Directions in Triangulation Nets IV
PERIODICAL: Geodeziya i kartografiya, 1960, No. 5, pp. 10-17

TEXT: In his publication "Adjustment of Traverse and Triangulation Nets" (Ref., footnote on p. 10) the author introduced a method for adjusting these nets. He developed formulas and schemes for the accurate adjustment of directions in free and unfree triangulation nets by evaluating the accuracy of measured elements and their functions. It is pointed out that the use of these formulas for adjusting large nets, and of triangulation nets in towns and mines is far more efficient than using the formulas for the adjustment according to conditioned observations. When using these formulas for the adjustment of unfree nets the conditional equations for the direction angles need not be set up as they are eliminated automatically during calculation. As far as the development of these formulas was dealt with in the article mentioned, formulas (1) and (10) are written down here, and their application is illustrated by an example for the case

- - a 1/2

Adjustment of Directions in Triangulation Nets

S/006/60/000/05/03/024
R007/B123

of equal observations. Finally, it is pointed out that only with a great number of fixed points it is more suitable to use the method of adjustment according to conditioned observations. There are 3 figures, 3 tables, and 1 Soviet reference.

Surveying in large-scale industrial construction (Geodeziya pri krupnom promyshlennom stroitel'stve) 2d ed., rev. Moscow, Izd-vo "Nedra," 1965. 299 p. illus., biblio. 4250 copies printed.

TOPIC TAGS: geodesy, geodetic survey, industrial construction, underground construction

PURPOSE AND COVERAGE: This is the second edition of a textbook on engineering geodesy, first published in 1957. The book deals with the problems of plotting geodetic networks and surveying the construction sites, as well as geodetic work in technical research on above-ground and underground means of transportation (industrial railroads, highways, pipelines, power and communication lines, etc). The layout of a construction network is analyzed in detail. Geodetic work to be completed in the process of construction of big industrial objects is outlined. The problems of geodesy are presented in connection with the technology of designing and building operations.

taking into account the application of the latest achievements of science and technology. The book is intended for engineers and technical geodesists, working in the field of planning, research, and construction of large industrial enterprises. It may also serve as a textbook for the students of geodesy at engineering institutes. There are 78 references, all Soviet.

TITLE: The balancing of leveling, theodolitic, polygonometric, and trigonometric networks with the "Ural" electronic digital computer

SOURCE: Ref. zh. Geodesiya, Abs. 11.52.247

REF SOURCE: Uravnoveshivaniye nivelirnykh, teodolitnykh, poligonometricheskikh i trigonometricheskikh setey na ETsVM Ural. M., Nedra, 1965, 187 str.

TOPIC TAGS: digital computer, computer program, coordinate, trigonometry, polygonometry, theodolite/ Ural digital computer

ABSTRACT: The book contains five programs compiled for the "Ural" computer, providing for operation of the computer in fixed point mode. 1. The node method is used in the program for strict balancing of leveling networks. The following conditions are imposed on the network: number of determined nodal points ≤ 60 , number of moves ≤ 120 , number of sections ≤ 25 . Single moves between solid points can be calculated. Excesses in a network can be obtained from geodetic or geometric leveling. A system of normal equations is solved by the approximation method. 2. Program of separate equalization of polygonometric networks and theodolitic moves. The program is compiled for the node method. Conditions:

Card 1/3

UDC: 528.16(076).681.1/2.2

L 00808-67

ACC NR: AR6014274

number of determinable nodal points ≤ 32 , number of moves ≤ 64 , number of lines in move ≤ 19 . Equalization of single moves which adjoin solid points is possible; here the number of moves in one series is ≤ 64 . There must not be solid directions at the points being determined. Normal equations are solved by the approximation method. The program provides for leveling of free networks. 3. Up to 64 moves can be handled in 1 by a program of strict balancing of single polygonometric moves. The number of sides in a move ≤ 19 . Calculation of the move takes $\sim 2.5-3$ min of machine time. 4. A program of two-group balancing of a polygonometric network permits balancing of networks with ≤ 8 nodal points to be determined; number of moves ≤ 20 ; number of lines in each move ≤ 14 . The program permits balancing of single moves. The system of normal equations is solved by the Gauss method. 5. The method of satisfactory measurements underlies the program of two-group balancing of trigonometric networks. The primary corrections of the directions are determined from the angle conditions, and the secondary, from the sine conditions. The following conditions are imposed on the network: number of points ≤ 18 ; number of points determined ≤ 10 , number of sides along which at least 1 direction is measured ≤ 28 ; length of sides not less than 100 m. There can be unilateral directions in the network. The initial data can be merely the coordinates of the solid points. Lists of working formulas, block diagrams, the order of preparation of the initial data, and the order of operation at the panel of the computer are provided for all programs. Examples of the compilation of the initial data are given. The balanced .

Abstract : The pine woods in the swamps of the forest range lands
belong to the five a and the fifth grades. The vegeta-
tional conditions improve under the influence of drying:
the upper swamps are upgraded to the 1-3 and the

Card 1/2

Abs Jour : Ref Zhur - Biol., No 4, 1958, 15384

the transitional swamps to the 2-4 class. The effectiveness of drying up the top swamps is seen with a thickness in the sphagnum peat of less than 50-70 cm. With a greater thickness the drying has no practical value. After drying, besides pine and birch, spruce and oak scrub appear. As a result of drying, the annual increase of pine wood was by some 2 to 3 cubic meters per hectare on the upper swamps and 2 to 5.5 on the transitional ones. The output of large and average sized wood varieties was raised.

TITLE	: The Influence of the Depth and Quality of Peat on the Pine Growth in Reclaimed Bogs.
ORIG. PUB.	: Dokl. AN BSSR, 1957, 1, No. 2, 76-79.
ABSTRACT	: During 1950-1953, there was investigated in Luninetskiy and Osipovichskiy laskhozes (Belorussia) the pine growth on reclaimed bogs with peat of different thickness and different quality. It was found that the total thickness of peat in reclaimed upland bogs does not influence the growth of the forest if the entire root system of the trees is located within the peat. The greater the thickness of the sphagnum layer, the poorer the forest growth. Drainage of upland swamps for the purpose of forest growing is inexpedient when the thickness of the sphagnum layer of the peat is more than 50-70 centimeters. If peat

ABSTRACT : thickness comprises 0.3-0.5 meters and the root system can reach the mineral ground after drainage, then reclamation produces a positive result in most cases. The efficiency of the forest growth will depend both on the peat thickness and on the abundance of nutrients in peat and in the underlying mineral ground. Investigations show that the improvement in pine growth is influenced not by the depth of the peat but by its ash content. -- V. I. Nekrasov

TITLE: On determining the resonance field from the magnetic rotation of the wave polarization plane

PERIODICAL: Akademiya nauk BSSR. Doklady. v. 6, no. 10, 1962, 642 - 645

TEXT: When investigating inner magnetic fields of pulverized ferrites by observation of the Faraday effect in a circular waveguide, the outer magnetic field, which corresponds to the gyromagnetic resonance, is determined as that field for which the angle of rotation is null on the curve of rotation of the wave polarization plane. This is correct for waves propagating freely in an unlimited, lossless, gyromagnetic medium, but it is not quite accurate in real experiments because of the effect of the following factors: 1. the waves propagate in waveguides, 2. the medium has losses, 3. the ferrite sample has a finite length. The object of the investigation, reported in this article, was to evaluate the influence of the mentioned factors. The calculations and experiments, reported in the article, demonstrate that determining the resonance field through

On determining the resonance field...

the rotation of the polarization plane leads to an error of only 1 - 2%. It is noted that this error is overlapped by the indefiniteness which exists in the relation between the resultant field, acting on the electron spins, and the internal magnetic field of the ferromagnetic sample. There are 1 figure and 1 table.
